

## Android

### Porting, tailoring and programming Google's Android OS

The Android operating system, developed by Google and based on the Linux kernel, is used more and more frequently not only on smartphones but also for dedicated embedded devices, notably in the "Machine to Machine" market.

**ac6-training** proposes trainings on the porting of the operating system on your board and its tailoring to your specific needs, as well as creating embedded applications running on the Android system.

You can see detailed course descriptions of the various trainings by using the above navigation bar. You can also click on course identifiers in the following course briefs hereafter.

#### Main Courses

**G1 - Android Installation** Android installation on a hardware platform

Installing Android on a new platform is a complex process; you need to port first the Linux kernel then install the Android platform. Even if using an existing Android Open Source Platform, the process to create an usable image is quite complex. This course will explain all the required steps, from building the kernel and the platform from source code to tailoring the boot process and creating test applications.

**G2 - Android Programming** Programming applications for the Android platform

Android was designed to allow quickly creating powerful and ergonomic interfaces for embedded, resource constrained, systems; however, due to the limitations of the underlying hardware, Android applications are totally different from standard applications. This course will explain how they are structured and how Android allows to combine portability and performance in applications.

**G3 - Android Internals, Android Frameworks and HAL Implementation**

Installing Android on a new platform is a complex process requiring a deep understanding of the internals of

**G5 - Android for Industrial System Control** Building friendly interfaces for industrial systems with Android

New industrial systems need sophisticated and ergonomic user interfaces. Building these with traditional Android

#### Additional Courses

**D3 - Linux Drivers** Writing Linux Drivers

This course covers the various techniques needed to write Linux (2.6 and 3.x) drivers, bus management (PCI, I2C, SPI, etc.)

**D7 - Power Management in Linux Drivers** Writing drivers with power management support

This course delves into the concepts of Linux drivers interaction with power management features of the Linux kernel.

**D8 - USB Linux Drivers** Writing USB 2.0 and USB 3.0 host and gadget drivers on Linux

This course details the Linux driver model, the USB hotplug and power management architecture to write U
