

Installing, programming and writing drivers

Industrial applications are more and more often performed using an embedded version of Linux. In addition, the very specific environment in which run these systems sometimes make it necessary to adapt the Linux installation to the hardware environment.

Ac6-trainingtrainings not only teach you how to build applications on embedded Linux, but also how to adapt the operating system to your hardware or environment when the need arises. **oD0 - Linux User Mode Programming** Programming Embedded Applications under Linux

- oD1 Embedded Linux Installing Linux on Embedded Systems Building and installing an embedded Linux platform
- **oD1Y Embedded Linux using Yocto**This course is the combination of the <u>oD1 Embedded Linux</u>course and <u>oY1 Yocto Project Development course</u>, to learn what is an embedded linux system and how to create it with Yocto
- **oD3 Linux Drivers** Writing Linux Drivers This course covers the various techniques needed to write Linux (2.6 and 3.x) drivers, bus management (PCI. ..), hot-plug and auto-configuration of devices as well as the specific problems due to multi-core and advanced processors.
- **oY1 Yocto Project Development** Building a Linux Embedded image using Yocto This course expects that you already are used to embedded Linux systems.
- **oY2 Yocto Project Expert** Advanced Yocto Project usage and adaptation This course expects you to already know how to build a Linux platform using Yocto (see our <u>oY1 Yocto Project Development</u> course)
- oY12 Comprehensive Yocto Project UsageThis course is the combination of the oY1 Yocto Project Development course and oY2 Yocto Project Expert course; it is intended for engineers that need to fully understand the Yocto build environment and be able to tailor it to their needs.
