

RM5 - Cortex-M33 Implementation

This course covers the Cortex-M33 ARMv8 core

Course objectives

- This course is split into 3 parts:
 - Cortex-M33 architecture
 - Cortex-M33 software implementation and debug
 - Cortex-M33 DSP programming.
- The Cortex-M33, although a 32-bit core, is one of the first ARMv8-M cores proposed by ARM and includes several advanced features.
- The Cortex-M33 low level programming is explained, particularly the ARM linker parameterizing and some tricky assembly instructions.
- The course also indicates how to use the DSP and FPU instructions to boost DSP algorithm implementation.
- The various Coresight debug elements implemented in the Cortex-M33 are also presented

Prerequisites

- Basic understanding of microprocessors and microcontrollers

Course Environment

- Labs will be executed on an ARMv8 simulator.
- Printed training material is given to attendees during training.
- Precise and easy to use, it can be used as a reference afterwards.

Plan

First Day

Introduction to ARMv8-M Architecture

- ARM Cortex-M33 processor macrocell
- ARMv8-M Programmer's model
- Instruction pipeline
- Fixed memory map
- Privilege, modes and stacks
- Memory Protection Unit
- Security extensions
- Interrupt handling

- Nested Vectored Interrupt Controller [NVIC]
- Power management
- Debug

ARM Cortex-M33 core

- Special purpose registers
- Datapath and pipeline
- Write buffer
- Bit-banding
- System timer
- State, privilege and stacks
- System control block

Architecture of a SoC based on Cortex-M33

- Internal bus matrix
- External bus matrix to support DMA masters
- Connecting peripherals
- Sharing resources between Cortex-M4 and other CPUs
- Connection to Power Manager Controller

Second day

Embedded Software Development with Cortex-M33

- Application startup
- Placing code, data, stack and heap in the memory map, scatterloading
- Reset and initialisation
- Placing a minimal vector table
- Further memory map considerations, 8-byte stack alignment in handlers

Exercise: Create a standalone C application displaying data on a serial line

The T32 Instruction Set variant supported on ARMv8M

- General points on syntax
- Data processing instructions
- Branch and control flow instructions
- Memory access instructions
- Exception generating instructions
- If...then conditional blocks
- Stack in operation
- Stack limit registers
- Exclusive load and store instructions, implementing atomic sequences
- Memory barriers and synchronization

Exercise: Create assembly-level functions to implement simple algorithms

Synchronization and Semaphores

- Exclusive access instructions
- The Local, Global and External monitors
- Interaction with exclusive access instructions
- Load Exclusive and Store Exclusive usage and constraints

Exercise: Implement atomic variable manipulation using exclusive access instructions

Exercise: Implement spinlocks

Cortex-M DSP Instruction Set

- Multiply instructions
- Packing / unpacking instructions
- V6 ARM SIMD packed add / sub instructions
- SIMD combined add/sub instructions, implementing canonical complex operations
- Multiply and multiply accumulate instructions
- SIMD sum absolute difference instructions
- SIMD select instruction
- Saturation instructions

Exercise: Code assembly-language optimized data-processing algorithms

Third day

CMSIS DSP support

- The CMSIS library framework
- The CMSIS DSP intrinsic functions
- The optimized CMSIS data-processing functions

Exercise: Recode data-processing functions in C using intrinsics

Exercise: Recode the same using CMSIS high-level data processing functions

Exercise: Compare performance of the various implementations

Floating point Unit

- Introduction to IEEE754
- Floating point arithmetic
- Cortex-M4F single precision FPU
- Register bank
- Enabling the FPU
- FPU performance, fused MAC
- Improving the performance by selection flush-to-zero mode and default NaN mode
- Extension of AAPCS to include FP registers

Exercise: Enable the FPU and use it for simple floating point algorithms

C/C++ Compiler hints and Tips for Cortex-M33

- Mixing C/C++ and assembly
- Coding with GCC compiler
- Measuring stack usage
- Unaligned accesses
- Local and global data issues, alignment of structures
- Further optimisations, linker feedback

Exercise: Measure stack usage of a program

Exercise: Place a user-defined data structure at a fixed address

Exceptions

- Exception behavior, exception return
- Non-maskable exceptions
- Privilege, modes and stacks
- Fault escalation
- Priority boosting
- Vector table

Exercise: Manage synchronous exceptions to simplify FPU usage

Exercise: Manage the SVC exception to switch between user and privileged modes

Fourth day

Interrupts

- Basic interrupt operation, micro-coded interrupt mechanism
 - Interrupt entry / exit, timing diagrams
 - Interrupt stack
 - Tail chaining
- Interrupt response, pre-emption
- Interrupt prioritization
- Interrupt handlers
- The Nested Vectored Interrupt Controller (NVIC)

Exercise: Handle a timer interrupt in C or assembly language

Exercise: Manage interrupt masking and nesting between two interrupts

The Security Extension

- Security states
- Register banking between security states
- Stacks and security states
- Security Extension and exceptions
- Secure state address protection
- Secure and Non-Secure states interactions
 - Secure state transitions
 - Function calls from Non-Secure to Secure state
 - Returning from Secure state
- Exceptions and the Security Extension
 - Handling Secure Exceptions
 - Handling Non-Secure Exceptions while in the Secure state
 - Returning from a Non-Secure exception to the Secure state
- The Security Attribution Unit
- The Implementation Defined Attribution Unit

Exercise: Implement a minimal secure monitor

Memory Protection Unit

- Memory types
- Access order
- Memory barriers, self-modifying code
- Memory protection overview, ARM v7 PMSA
- Cortex-M4 MPU and bus faults
- Fault status and address registers
- Region overview, memory type and access control, sub-regions
- Region overlapping

Exercise: Use the MPU to protect an area of memory against unintended access

Debugging features

- Invasive Debug
 - Coresight debug infrastructure
 - Halt mode
 - Vector catching
 - Debug event sources
 - Flash patch and breakpoint features
 - Data watchpoint and trace

- ARM debug interface specification
- Coresight components
- AHB-Access Port
- Possible DP implementations: Serial Wire JTAG Debug Port [SWJ-DP] or SW-DP
- Non-Invasive debug
 - Basic ETM operation
 - Instruction trace principles
 - Instrumentation trace macrocell
 - ITM stimulus port registers
 - DWT trace packets
 - Hardware event types
 - Instruction tracing
 - Synchronization packets
 - Interface between on-chip trace data from ETM and Instrumentation Trace Macrocell [ITM]
 - TPIU components
 - Serial Wire connection

Renseignements pratiques

Duration : 4 days
Cost : 2400 € HT
