

## Y12 - Comprehensive Yocto Project Usage

### Objectives

- Using and customizing Yocto
- Creating Yocto-based Embedded Linux platforms
- Using Yocto to develop components
- Customizing the BSP
- Building out of tree modules
- Setup Source cache

*Labs are conducted QEMU ARM-based board*

*We use a recent version of Yocto*

### Prerequisite

- Good C programming skills (see our [L2 - C language for Embedded MCUs](#) course)
- Knowledge of Linux Embedded systems (see our [D1 - Embedded Linux with Buildroot and Yocto](#) course)
- Preferably knowledge of Linux user programming (see our [D0 - Linux user mode programming](#) course)

### Course environment

- Printed course material (in English)
- One Linux PC for two trainees.
- One target platform for two trainees

### Plan

#### First Day

#### **Introduction to Yocto**

- Overview of Yocto
  - History
  - Yocto, Open Embedded and Poky
  - Purpose of the Yocto project
  - The main projects
- Yocto architecture
  - Overview
  - Recipes and classes
  - Tasks

## The Yocto build system

- Build system objectives
  - Building deployable images
  - Layers and layer priorities
  - Directory layout
  - Configuration files (local, machine and distribution)
  - The bitbake tool
- Using Yocto
  - Building a package
  - Building an image (root file system + u-boot + kernel)
- Miscellaneous tools around Yocto
  - Yocto SDK
  - Extensible SDK

*Exercise: Building a root file system using Yocto*

*Exercise: Use bitbake commands to build package & images*

*Exercise: Building a root file system using Yocto*

*Exercise: Build an extensible SDK for the generated image*

*Exercise: Deploy the generated image*

## Yocto package recipes structure

- Recipe architecture
  - Tasks
  - Task dependencies
  - Recipe dependencies
- The bitbake language
  - Standard variables and functions
  - Classes and recipes
  - The base Yocto classes
  - Main bitbake commands
- Adding a new layer
  - Layer structure
  - Various kinds of layers

*Exercise: Adding a new layer*

## Second Day

## Writing package recipes for Yocto

- Various kind of recipes and classes
  - Bare program
  - Makefile-based package
  - autotools-based package
  - u-boot
  - kernel
  - Out-of-tree module
- Recipe creation strategies
  - From scratch
  - Using devtool
  - Using recipetool
  - From an existing, similar, recipe
- Debugging recipes
  - Debugging recipe selection
  - Debugging dependencies

- Debugging tasks
- Defining packaging
  - Package splitting
- Automatically starting a program

*Exercise: Writing a recipe for a local user-maintained package*

*Exercise: Writing and debugging a package recipe for an autotools-based package*

*Exercise: Starting a program at boot (systemd)*

## Modifying recipes

- Customizing an existing package recipe (.bbappend)
- Recipe dependencies
- Creating and adding patches
  - Creating a patch for a community-provided component
  - Creating a patch for an user-maintained component
- Defining new tasks
  - Task declaration
  - Coding tasks

*Exercise: Adding patches and dependencies to a community package*

*Exercise: Adding a rootfsinstall task to directly copy the output of a user package in the rootfs image*

## Third Day

### Creating new kinds of recipes

- Creating classes
  - Creating new independent classes
  - Inheriting from an existing class

*Exercise: Create a class to generalize the “rootfsinstall” task*

### Creating a root file system

- Building a root file system with Yocto
  - Creating a custom root file system
- Writing an image recipe
  - Selecting the packages to build
  - Selecting the file system types
  - The various kinds of images
- Inheriting and customizing images
  - Customizing system configuration files (network, mount points, ...)
- Users and groups management
- Package management
  - rpm
  - opkg

*Exercise: Writing and building an image recipe*

*Exercise: Add new users to the image*

*Exercise: Create an image with package support for OTA deployment*

*Exercise: Test OTA update on the generated image*

## Fourth Day

### Development process using the extensible SDK and devtool

- Using devtool to create a package and its recipe

- Using devtool to modify an existing package and recipe
  - Using devtool to update a recipe to build a new version of a package
- Exercise: Create, test and modify a recipe for an existing package using devtool*

### Develop and debug applications using SDK and eclipse

- Adding eclipse remote debug packages
  - Configuring eclipse
- Exercise: Create remote debugging session using eclipse*

### Writing tasks in python

- Introduction to python
  - Using python in Yocto
    - The main bitbake classes
    - Defining variable values in Python
    - Writing tasks in Python
- Exercise: Writing a task and customizing a recipe in Python*

### Porting Yocto

- Porting Yocto to a new board
  - BSP architecture
    - Selecting and configuring u-boot recipe
    - Selecting and configuring kernel recipe
  - Adding a new BSP layer (yocto-bsp create)
- Exercise: Creating a new BSP layer*

### Fifth Day

### BSP Development

- Adding a custom u-boot to Yocto
  - Customizing the Yocto kernel recipe
    - Setting the default configuration
    - Adding patches
    - Specifying the kernel sources
  - Configuring Linux Kernel
    - Using menuconfig
    - Using patches
    - Creating Configuration Fragments
    - Validating Configuration
  - Kernel device tree
- Exercise: Create u-boot and kernel recipes to use custom versions, test the result*
- Exercise: Patch kernel and activate new options using a fragment*
- Exercise: Create and use a new device tree*

### Out-of-Tree Modules

- Adding modules to image
  - Creating an out-of-tree module
  - Kernel modules with eSDK
- Exercise: Build and test modules*

### Tailoring the build system

- Setting up a Yocto source cache
  - Local, per system, cache setup
  - Setting up a global, network wide, cache
- Customizing the build system
  - Using a prebuilt toolchain
  - Using a pre-compiled kernel
- Optimizing Yocto build times
  - Using prebuilt, binary, packages
  - Using shared compilation caches

*Exercice: Setting up a global source cache*

*Exercice: Setting up an optimized build environment and rebuilding an image*

## Renseignements pratiques

**Duration : 5 days**  
**Cost : 2930 € HT**
