oY1 - Yocto Project Development

Building a Linux Embedded image using Yocto

Objectives

• Using and customizing Yocto

dC6

- Creating Yocto-based Embedded Linux platforms
- Using Yocto to develop components

Labs are conducted QEMU ARM-based board We use a recent version of Yocto

Prerequisite

- Good C programming skills
- Knowledge of Linux Embedded systems (see our <u>oD1 Embedded Linux</u>course)
- Preferably knowledge of Linux user programming (see our <u>oD0 Linux User Mode Programming</u>course)
- You may be interested also by the Yocto Expertcourse or the combined (oY12 Comprehensive Yocto Project Usagecourse)

Course Environment

- Theoretical course
 - PDF course material (in English).
 - Course dispensed using the Teams video-conferencing system.
 - The trainer answers trainees' questions during the training and provide technical and pedagogical assistance through the Teams video-conferencing system.
- Practical activities
 - Practical activities represent from 40% to 50% of course duration.
 - Code examples, exercises and solutions
 - One Online Linux PC per trainee for the practical activities.
 - The trainer has access to trainees' Online PCs for technical and pedagogical assistance.
 - Eclipse environment and GCC compiler.
 - QEMU Emulated board or physical board connected to the online PC (depending on the course).
 - o Some Labs may be completed between sessions and are checked by the trainer on the next session.
- Downloadable preconfigured virtual machine for post-course practical activities
- At the start of each session the trainer will interact with the trainees to ensure the course fits their expectations and correct if needed

Duration

- Total: 18 hours
- 3 sessions, 6 hours +/-30 min each (excluding break time)
- From 40% to 50% of training time is devoted to practical activities
- Some Labs may be completed between sessions and are checked by the trainer on the next session

Target Audience

• Any embedded systems engineer or technician with the above prerequisites.

oY1 - Yocto Project Development

Evaluation modalities

- The prerequisites indicated above are assessed before the training by the technical supervision of the traineein his company, or by the trainee himself in the exceptional case of an individual trainee.
- Trainee progress is assessed in two different ways, depending on the course:
 - For courses lending themselves to practical exercises, the results of the exercises are checked by the trainer while, if necessary, helping trainees to carry them out by providing additional details.
 - Quizzes are offered at the end of sections that do not include practical exercises to verifythat the trainees have assimilated the points presented
- At the end of the training, each trainee receives a certificate attesting that they have successfully completed the course.
 - In the event of a problem, discovered during the course, due to a lack of prerequisites by the trainee a different or additional training is offered to them, generally to reinforce their prerequisites, in agreement with their company manager if applicable.

Plan

Session 1

Introduction to Yocto

- Overview of Yocto
 - History
 - Yocto, Open Embedded and Poky
 - Purpose of the Yocto project
 - The main projects
 - Yocto architecture
 - Overview
 - Recipes and classes
 - Tasks

The Yocto build system

- Build system objectives
 - Building deployable images
 - Layers and layer priorities
 - Directory layout
 - Configuration files (local, machine and distribution)
 - The bitbake tool
- Using Yocto
 - Building a package
 - Building an image (root file system + u-boot + kernel)
- Miscellaneous tools around Yocto
 - Yocto SDK
 - Extensible SDK

Exercise: Building a root file system using Yocto *Exercise:* Use bitbake commands to build package & images *Exercise:* Building a root file system using Yocto *Exercise:* Build an extensible SDK for the generated image *Exercise:* Deploy the generated image

Yocto package recipes structure

- Recipe architecture
 - Tasks
 - Task dependencies
 - Recipe dependencies
- The bitbake language

- Standard variables and functions
- Classes and recipes
- The base Yocto classes
- Main bitbake commands
- Adding a new layer
 - Layer structure
- Various kinds of layers

Exercise: Adding a new layer

Session 2

Writing package recipes for Yocto

- Various kind of recipes and classes
 - Bare program
 - Makefile-based package
 - $\circ~$ autotools-based package
 - u-boot
 - kernel
 - Out-of-tree module
- Recipe creation strategies
 - From scratch
 - Using devtool
 - Using recipetool
 - From an existing, similar, recipe
- Debugging recipes
 - Debugging recipe selection
 - Debugging dependencies
 - Debugging tasks
- Defining packaging
 - Package splitting
- Automatically starting a program

Exercise: Writing a recipe for a local user-maintained package *Exercise:* Writing and debugging a package recipe for an autotools-based package *Exercise:* Starting a program at boot (systemd)

Modifying recipes

- Customizing an existing package recipe (.bbappend)
- Recipe dependencies
- Creating and adding patches
 - Creating a patch for a community-provided component
 - Creating a patch for an user-maintained component
- Defining new tasks
- Task declaration
 - Coding tasks

Exercise: Adding patches and dependencies to a community package *Exercise:* Adding a rootfsinstall task to directly copy the output of a user package in the rootfs image

Session 3

Creating new kinds of recipes

- Creating classes
 - Creating new independent classes
 - Inheriting from an existing class

Exercise: Create a class to generalize the "rootfsinstall" task

Creating a root file system

- Building a root file system with Yocto
 Creating a custom root file system
- Writing an image recipe
 - Selecting the packages to build
 - Selecting the file system types
 - The various kinds of images
- Inheriting and customizing images
 - Customizing system configuration files (network, mount points, ...)
- Users and groups management
- Package management
 - rpm
 - opkg

Exercise: Writing and building an image recipe *Exercise:* Add new users to the image *Exercise:* Create an image with package support for OTA deployment *Exercise:* Test OTA update on the generated image

Renseignements pratiques

Inquiry : 18 hours Prochaines sessions : from 25th to 27th of June, 2025 - Online EurAsia (9h-16h CET)
